1.0 Scope

This procurement specification is issued on behalf of Oak Ridge National Laboratory (ORNL), hereafter referred to as the Company. It is a “build-to-print” procurement and contains the requirements for the fabrication and assembly of the primary containment components consisting of

1) Sump Tank Assembly,
2) Hg Discharge Assembly, and
3) Hg Inlet Assembly.

These assemblies provide the storage and most of the primary containment for the Mercury Intense Target (MERIT) system. MERIT will be used to perform tests at ORNL, MIT’s Plasma Science and Fusion Center, and CERN in Switzerland.

Acceptance tests at the Seller’s site shall consist of checking certain critical dimensions, and verifying the leak-tightness of the containment structure. Upon completion of the acceptance tests, the equipment shall be delivered to ORNL in Oak Ridge, TN.

*It is pointed out that although this support equipment is for a mercury-based target experiment, the Seller will not deal with nor handle mercury in any way*

Under the provisions of this subcontract the Seller shall provide the following:

1. Items 3-6 of the Primary Containment Assembly (Drawing 203-HJT-0600), including
   - Hg Sump Tank Assembly (Drawing 203-HJT-0640)
     - Fully assembled components shown in the drawing package with the exception of the sump tank cover and gasket (203-HJT-0642 and -0643).
   - Hg Syringe Discharge Piping (Drawing 203-HJT-0670)
     - Fully assembled components shown in the drawing package.
   - Hg Syringe Inlet Piping (Drawing 203-HJT-0680)
     - Fully assembled components shown in the drawing package.

2. Furnish the Company with as-built drawings or drawing mark-ups for any fabrication deviations that were approved by the Company.
The attachment to this specification contains the drawings referenced above. The drawings, in addition to specifying dimensions, also specify component materials, commercially available procurements, and field notes that refer to welding and inspections, and material certifications.

Since the components listed above will be used during MERIT testing in high magnetic fields, all materials are to be non-magnetic. Any deviation from the materials listed in the drawings must be approved by the Company. However, stainless steel type 316L may be substituted for type 304L without Company approval provided the material certifications indicate the change.

2.0 Applicable Codes and Standards

- American Welding Society D.1 – standard practices
- American Society of Mechanical Engineers Boiler and Pressure Vessel Code Section IX

3.0 Inspection and Testing

As part of the Company’s quality assurance program, the Company shall have the right to inspect the Seller’s facility or any sub-tier Seller facility that the Company determines necessary to ensure that quality objectives are met. Source surveillance by the Company representative shall in no way relieve the Seller of the responsibility to furnish acceptable items.

3.1 Acceptance Testing

The Company shall have the right to witness final functional testing and inspection of the equipment at the Seller’s site. Such testing shall be specified by the Seller to ensure full compliance of the equipment with the requirements of this specification. The requirement for witnessed-tests and inspections are at the Company’s discretion upon notification by the Seller that the work has been completed. Acceptance tests shall take place at the Seller’s site using the actual components, equipment, and materials that will be delivered to the Company.

Final acceptance tests of the primary containment assemblies shall include checking several critical dimensions, verifying the leak-tightness & pressure-retaining capabilities of the containment assemblies, and integration tests with the syringe pump. The final acceptance tests shall consist of the following:

- The sump tank shall be filled to height of 8-1/2 inches with water and demonstrate no liquid leakage through the base of the tank or any of the wall penetrations.
- The assembled primary containment shall be pressurized to 5 psig, after all openings are sealed, and a soap bubble test shall be applied to all flanged covers, gasketed joints, and welded joints to verify leak tightness.
• The complete outlet piping assembly shall be pressure tested to 2250 psig, and the inlet piping assembly between the check valve and the drain tube shall also undergo a pressure test of 2250 psig.
• The integration test will consist of demonstration of the gravity intake operation and successful discharge of a water jet.

3.2 Seller’s Responsibilities

The Seller shall notify the Company ten (10) working days prior to the start of tests and inspections that are designated above. The Company at its discretion shall have representatives witness the performance tests. In addition, the Seller shall supply the Company with material certifications as specified on certain drawings in the attached drawing package.

4.0 Quality Assurance

4.1 Non-Conforming Items

The Company expects to receive equipment items, components, materials, and documentation that conform to all codes, standards, specifications, and procedures in the Agreement. The Seller may use its own nonconformance program to identify, report, and recommend disposition of all non-conforming items, but disposition that would leave any remaining nonconformity must be submitted to the Company for approval. A nonconformity request should identify the affected item(s) by name and serial number (if applicable), citing the drawing/specification number and revision number containing the specific requirement that has not been met. The Seller or the Seller’s supplier may attach a description of the cause, and a corrective action plan and schedule if pertinent.

Note: The issuance and acceptance of such a request does not limit or affect the warranty provision of the Agreement. Such a request shall not establish a precedent or obligation to accept existing or future items not conforming to all provisions of the Agreement.

4.2 Seller’s Requested Deviations

The Seller may propose deviations from the specifications, drawings, or other technical requirements of this procurement. Where time is a consideration, the Seller may communicate the proposed deviations or changes directly to the Company’s principal engineer or technical lead with a copy to the Company’s buyer. The engineer or technical lead will evaluate the technical aspects and recommend to the buyer, who will communicate acceptance or disapproval to the Seller. The request should identify the affected items, drawing/specification number and revision number, a description of the proposed deviation, and the justification for it.
4.3 As-Built Drawings

The Seller shall note any changes to the drawings due to errors or missing information, or changes to the components due to Company approved deviations, and provide the Company with a copy of the marked-up drawings.

5.0 Schedule

The primary containment fabrications and acceptance testing shall be completed 7 weeks after subcontract award. Delivery to ORNL shall take place immediately thereafter.

6.0 Packing, Shipping and Handling

The containment structure assembly shall be packed for shipping in a sturdy cardboard or wooden crate with loose pieces suitably wrapped to prevent damage during shipment, and shipped by ground transport.

6.1 Equipment Identification

Each major assembly or component shall be tagged indicating the Seller’s name and address, the Seller’s equipment identification information, date of manufacture, and Company information as shown below:

- Seller name and address
- Seller equipment identification number
- Date of manufacture

UT-Battelle, LLC
ORNL, MERIT Hg Target Experiment
Oak Ridge, TN 37831
Specification No.203-HJT-9001.
